CDF Checklist of Galapagos Zooplankton

Nathalia Tirado

16 Jun 2011

This checklist is automatically generated using Version 3.0 of the online database CDF Galapagos Species Checklist.

The term **plankton** refers to an ecological group of organisms that drift in the water column of the oceans and fresh water bodies. Organisms that belong to the zooplankton are animals, i.e., they are heterotrophic feeding on other plankton or on detritus. Most zooplankton species are too small to be seen individually with the naked eye. Zooplankton is a broad category including a range of different sizes, such as microscopically small protozoans and larger metazoans. Holoplankton complete their entire life cycle as plankton, meroplankton spend part of their life cycle as planktonic larvae, but as adults float near the surface or become anchored. Even though zooplankton is primarily transported by ambient water currents, many species can actively move to avoid predators or to seek prey. Many zooplankton species feed on bacterioplankton, phytoplankton, and other zooplankton (some species show cannibalistic feeding behavior), detritus, and even larger free-swimming organisms (the nekton). As a result, zooplankton is found in surface water where food is most abundant.

For marine species distribution data cited in the CDF Galapagos Checklists refer to the five main bioregions of the archipelago (Far Northern, Northern, Western, South Eastern and the Elizabeth Bay Bioregion). For the terrestrial species the more than 120 islands, islets and small rocks have been aggregated into Islands Groups, thus, for example, the island group “Santa Cruz” includes smaller islands like Santa Fé, Plaza Norte, Plaza Sur, Baltra, Daphne Mayor, Daphne Minor, and others.

Please be aware that the distribution data presented here is automatically generated from specimen records and does not always accurately reflect the known distribution for all species.

IUCN red-list assessments presented here may deviate from the global IUCN list for the following reasons:
- for well known species groups like vascular plants or vertebrates updates proposed to the IUCN are shown instead of the outdated, but currently accepted status;
- for poorly known species groups (e.g., lichenized fungi) a general assessment is currently not possible and the list presented here is a regional red-list list for Galapagos archipelago.
